Considering a Dental Implant?

Seeking participants interested in research about dental implant health.

The UIC College of Dentistry Clinical Research Center is performing a research study on dental implant therapy. The purpose of this study is to evaluate the long term performance of a newly developed implant procedure for replacing single teeth with a dental implant. The new procedure is that the crown will be fixed by means of friction instead of commonly used cement or screws. This new procedure may lead to easier handling of the crown. The Principal Investigator is Lyndon F. Cooper, DDS, PhD.

Individuals 18 – 75 years old must desire an implant for an already missing tooth or for a tooth that will soon be extracted. Participants will be evaluated for study eligibility and if eligible, will visit the clinic a minimum of 11 times over approximately 5 years.

This study (UICIRB protocol # 20191044) will be performed within UIC College of Dentistry’s Clinical Research Center at 801 S. Paulina, room 105.
